LEWIS & PEAT.

6, Mincing Lane,
London, E.C.

20 January 1883.

W. Thistleton Dyer Esqr.

Dear Sir,

We beg to hand you as requested report upon the samples of Bark from Central America, which our friend the dyer has examined; but are sorry to say we are unable to give you any further information – viz:–

"Have just finished careful test of the samples"
"of Bark &c referred to in your favour. Nos 1.2.5.6.7.9."
"10. 12. 13. 15. 16. 17. 19 & 20. contain only traces of colouring matter"
"& are of no commercial value. Nos 3. 4 & 14 are not much better"
"than the foregoing. No 11. contains more colouring matter but"
"neither in quantity no quality to be of use".
" No 18 is apparently Mangrove Bark & contains a considerable"
"quantity of a reddish brown dye that might be useful,"
"but the abundance of materials that give the same shade"
"would limit its value. The only one amongst the lot"
"likely to be of any commercial value is No 8 which contains"
"a fair amount of tannin, but sample is too small to"
"form anything like a correct estimate of its worth for"
"tanning purposes".

We are, dear Sir,
Yours faithfully,
Lewis & Peat

"The specimens of wax sent herewith have been prepared from the seeds of Myrica microcarpa Bth. an arborescent plant growing abundantly on the hills of Jamaica at elevations of about 5,000 feet

The seeds were simply boiled with water for about half an hour and then allowed to cool the wax forming (when cool) a cake on the surface of the water. This was melted again in an earthen vessel to allow the dross to settle to the bottom, after which the wax becomes clean and clear"

28 Foreign Office 72.

The following specimens illustrating the economic use of the bulbs of Lilium cordifolium in Japan.

Japanese name "Ubaguri"
Ainu name "Kiu"

1 Fibre from which starch has been partially extracted. After the bulbs have been well washed and soaked in water for two days and night they are pounded in a wooden mortar and then transferred to a tub filled with water. The mass is thoroughly kneaded with the hands and allowed to stand for a night to enable the starch to settle after which the cellular mass is taken out and dried.

2 Cakes made of the above fibre, by pounding it in a mortar with a little water & then kneading the mass into shape with the hands. The cakes are hung up to dry in the Ainu huts. The discoloration is caused by smoke. The cakes and fibre are not eaten by the Japanese. The Ainu boil and eat them either "au naturel" or mixed with rice.

April 1884.

21 Foreign Office. (G. Phillips Esq Consul Swatow) 65.
Two pieces of Wood of Sung-lo-shan (Cunninghamia sinensis) used at Swatow for making tea chests.

23rd L. J. K. Brace Esq. 9
Calcutta.

One finished and one blank book of leaves of the Tal (Borassus flabelliformis) also a style as used by the Ooriyas of Orissa. To prepare them the young and unexpanded leaf (the old ones are too brittle) is taken and well dried in the sun then covered with sand for two or three days (said to prevent the leaf turning black) then placed to steep in the muddy bottom of a tank to prevent the attacks of insects. The leaves are then separated into single strips and cut to the size required about 2 inches long and strung together by passing a string through a hole in the centre of each strip. Pieces of wood are then placed outside. The style is called 'Lickan'. After the writing is finished it is rubbed over with a leaf of Datura Stramonium the juice of which carries with it a little dirt into the scratches and makes them more distinct

Stems of [illegible] Bamboo. The larger stems are used for staves the smaller and less mature for Opium pipes and the smaller and less mature for tobacco pipes

1/4

February 1885.

2nd Dr. Macgowan contd. 22.

2 Tobacco pipe made of square bamboo with pouch containing a sample of Wenchow tobacco and shredded leaf imported from Ningpo — Pouch made of coarse Wenchow silk! [leather]. Paper enclosing Tobacco made of the "Hairy Bamboo"

3. Four panels made of the stems of the "Hairy Bamboo". The mature stems are cut in pieces about 6 inches long slit longitudinally and boiled for two hours in water this causes them to become flexible. They are flattened by pressure and dried which takes about 10 days — when properly dried they retain their sheet like form. The siliceous surface is pared off and the inner surface also until it presents a white appearance, when they are ready for carving and various kinds of inlaid work. The panels are intended to represent

1 Riding the Water Buffalo home

2. Fishing by the Bamboo clad stream.

3 & 4 Undefined

[illegible]

4. Piece of flattened bamboo prepared for carving

Durban Club.
1. Specimens of Insect Wax from Natal used by the Zulu Warriors for the making of the head ring. It takes a beautiful polish
2. Photo of two Zulus wearing the head ring made of Insect Wax.

see next page.

February 1886

1st Extract of letter from Col. Bowker accompanying above specimens. 13

Insect wax well known all over S. Africa, its favourite tree is the common Mimosa but it is obtained from a number of other trees as well and I think would pay as an article of trade. In Natal it is to be met with in considerable quantities and is not confined to the Mimosa tribe alone it is the staple article used by the Zulu warriors for the making of the head ring and takes a most beautiful polish. In passing along a road it is a usual sight to meet with two or more young men sitting by the side of the road giving each other a friendly touch or polish before entering a town, village or Kraal just the same as we should employ a shoe-black in the streets of London. If it is of any value any quantity can be procured in Natal.

6th J. Heathcote Esqre 111

per Prof. MacOwan

Gum bark and fruits of Inhambane Copal Copaifera Gorskiana, Bth.

Wood like Sandal wood. It is ground & mixed with water and used by the natives at Inhambane E. Africa to anoint themselves. (Croton sp.?)

Kersall, Manchester

1 Esculin from Horse Chestnut bark
2. Xanthorhamnin, the glucoside of Persian berries and a sample of the berries from which the Xanthorhamnin was prepared.

March 1888

31st Dr. E. Schunck contd. 36.

Extract of letter from Dr. Schunck to the Director dated 27/3/88: "1 Æsculin from Horse Chestnut bark "specially prepared, a very fine specimen.
"2 Xanthorhamnin, the glucoside of Persian "berries to which the tinctorial properties of the "latter are due. This is a very stable body, "as may be inferred from the fact that this "specimen was prepared from berries that had "been kept in a drawer for more than 25 years. "I think it desirable however that it should be "kept from direct sunlight.

April 3rd Prof. T. Kirk 37

1. Cones of Pinus Armandi, Franch. 5327 B
2. " " Picea Davidiana, Franch (not mept) 7596 } [illegible] in Herb. to the [illegible]
3. Two cones of Abies [illegible] ? 7156
4. Pegs made of Quercus aliena, Bl. which are driven into the varnish tree at intervals of about one foot apart and serve as steps by which the tree can be ascended ~~[illegible]~~ incised for the varnish.

The varnish is collected in various ways, the receptacles being placed in a cut which is a little below that one from which the varnish will flow out. A.B = cut made, the varnish gradually oozes out and goes to lower end B and from thence flows into receptacle which is put into a cut D C. The receptacles are sometimes shells and sometimes bits of bamboo of which specimens have been sent

August 8th Henry Groves Esqre. 91.

Rope made of Ampelodesmos tenax from Monte Argentario on the extreme south of the Tuscan Coast used in Tunny fishery. The rope is a piece of the standing net of the "Tonara" with which they make the long arms that extend far into the sea and lead the fish up to the central enclosure where the moveable net is situated. Ropes of a larger size are used by the Trawlers which go in pairs and with all their wear and tear last a year. For hauling ropes of ordinary nets they last two years – for Tunny gear if kept in the water so as to avoid the action of the sun they last many years.

Not Kept.

[illegible] Extract of letter from Mr H. N. Ridley 125

Gardens & Forest Dept. Singapore

I am sending a box to you containing two implements used in Gambier manufacture, one is an article of Tampenis Wood (Sloetia sideroxylon) used in stirring round the boiling leaves. The Chinaman who uses it twirls it round like a mop, in the leaves. This is the hardest work in Gambier making. The other is a kind of fork used in lifting out the leaves after the boiling is done.

Neray bark (Carapa moluccensis) used in dysentery – It is a Mangrove swamp tree, never very large, the bark peels off and falls at the foot of the tree which is often covered with the fallen bark – Neray bark has quite a reputation here among certain of the natives.

A. G. Tillson Esqre ✓ 17.
Curator
Botanical Station, Antigua

Samples of Cut-hand grass consisting of
1. Fresh grass of Paspalum virgatum
2. Beaten & dried do do
3. Herb. specimen do do. in flower.
4. New rope of do do. also a sample of rope after about three months wear.

The grass is cut low with a knife, beaten on a lignum Vitae block with an Acacia wood mallet and dried in the sun & afterwards twisted into rope. The rope generally lasts 3 or 4 months in the salt water and is taken out with the fish-pot twice weekly and immediately replaced in the water. Being light it does not sink so low as as hempen rope nor does it shrink like the latter – it is made and sold by the natives at 6d per 9 fathoms.

31st H. E. The Govr of the Leeward Isds 18

Brigadier Genl. John Jopp

Political Resident, Aden. {per India Office} 34.

1. Cake of Barilla as prepared at Bir Ahmed near Aden.
2. Specimens of the plant prepared for burning and samples of the green plant. (*Suæda fruticosa*, L.)

The following is an extract of a letter from Brig. Gen. J. Jopp accompanying the specimens and dated Aden 8th January 1891:-

"I have the honour to forward to your address "a case containing a cake of the barilla "as prepared at Bir Ahmed (near Aden) where "it is best made. It is broken in two pieces "but this is a proof of its good quality as "the inferior cakes only remain whole. . . .

. . . . 2. The mode of preparation "is as follows:- The young green twigs at "the ends of the branches are picked and "left on the ground in the Sun for seven days "at the end of which time they turn black "but are full of moisture. Shallow pans

1891

31/ February 25th — Brigadier Genl. John Jopp contd. — 34.

"Shallow pans with a diameter of from 18" to "2' are then dug in the sand and the "blackened twigs are put into them and "then ignited and allowed to burn for "some hours at the end of which time "they become a viscous pulpy mass which "is gently stirred with a stick until it cools, "which it does in six hours, and on the "following day the solid cake is removed. Should "rain or water fall on the picked twigs they "become useless.

3. "The bush is now at its brightest "and freshest. I have also enclosed some "specimens of the flower as at present growing "on most of the plants. They were picked on "the 1st of January and the specimens of the "plant on the same day."

5. Fruits " Fraxinus oxyphylla

All used as drugs in Persia.

June 24th

1891

George Arbuthnot Moore Esqre
41 Tower Buildings
Liverpool

89

Sample of fibre said to be from the pinnæ of the African Oil palm (Elæis guineensis). Messrs Ide & Christie report "This fibre has been known to us for the last 13 years at least but only in small samples such as you send us. It has never been receiv'd in merchantable quantity to our knowledge and hence no practical experiments have been made with it. Some spinners to whom it was shown when the first specimens came to hand stated as their opinion that it was too hard and gritty to spin readily but we are inclined to think this view might have been modified had they had the opportunity of testing it practically. It has great strength and fineness and if really spinnable we would value it at £50 to £60 per ton today in London.

" 27th

Dr Treub
Director, Govt Botanic Gardens
Buitenzorg, Java.

23rd

1891

H. N. Ridley Esqre ✓ 148

Singapore

Instruments &c. used in the manufacture of Gambir as follows:-

1. Rubbish basket, used for taking away the used leaves which are thus carried to the pepper plantations or gambir fields for manure. (2)
2. Basket for bringing the fresh cut leaves to the factory. (3)
3. Tub for the liquid gambir. In this tub the gambir is set. (4)
4. Fork of 'tampinis' wood (Sloetia sideroxylon) for *stirring the gambir leaves in the boiling pan. (5) *evidently an error - this implement is used to remove the spent leaves. (See 125. [illegible])
5. Cocoa nut shell strainer (6). This is fixed on to a kind of sieve (which I have not been able to get yet) by the handle so that it hangs down in the Gambir liquid while still boiling and after the larger debris have been taken out by the coarse strainer (No. 7) as the liquid boils the small bits whirling round drop into the cocoa-nut shell and are taken out.
6. Knife for  cutting gambier in the field (8)
7. Chopper for chopping up twigs and leaves before putting into the boiler. (9)
8. Stick used in setting the liquid made of Mahang wood (Macaranga hypoleuca) (10)
9. Dried Gambier leaves (11)
10. Model of a Gambir factory.

November 1891.

23rd Messrs Edwards Bros. 149.
Alexandra Building, Ormond Street
Liverpool
Sample of a balsam received in Liverpool as Balsam Copaiba from W. Coast Africa, apparently a species of Boswellia.

February 1893

16th Revd W. M. Oxley ✓ 24.

Vicar of Petersham

Roots of a Wistaria from the Dining Room of Eldor House, Ham just demolished. The root entered the room by a very small chink in the side of the window, near the ceiling and on removing the paper which had not been disturbed for many years from the walls of the room about 14 feet square) the whole of the plaster beneath the paper was found covered with a fine network of roots spreading all round the room. The specimen is about 1/3 of the whole roots and the stem where it entered the room there was not the faintest appearance of anything of the sort on the surface of the wall-paper to give rise to the suspicion of these roots being there, and the room was continually inhabited, with fires &c

75 Brook Green
London, W

Portion of a branch of the Great Oak tree known as Abraham's Oak from near Hebron. The branch was broken off in 1856 by the weight of snow. "We purchased it and had it cut up and brought to Jerusalem in 7 camel loads. The greater part was made up into small articles of furniture and sold for the benefit of poor Jews in Palestine. The tree is greatly reverenced by the Jews and Moslems in memory of Abraham the friend of God on account of a tradition that he used to sit under its shade and there received the visit of the angels. We do not consider that though ancient the tree is nearly so old as that tradition would imply. Mr Finn was Consul for Jerusalem and Palestine."

131.

Two sections of wood with the following information

Sulymah 10th July 1893. Travelling Commissioner Alldridge to Colonial Secretary.

"I have for a long time endeavoured to discover a wood which would approximate in colour and other details to the specimen of Barwood submitted to me - but although I have employed an American sawyer to search for it in the Bush - and I have shown the specimen to many chiefs and others, I have not been successful in finding anything which in any way compares with it - nor does the wood appear to be known. One chief after a careful examination, thought that possibly it might be the Wild Kola tree, called in Gallinas "Wurun Juro" and in Mende "Taroru" and at my request he has today sent me down a specimen which I now have the honour to forward to you - it certainly shews no similarity at present with the Barwood specimen unless it be its lightness

Put in Museum Case awaiting further information

August 1893.

19th Colonial Office contd. 131.

in weight, but I am assured that it will turn a reddish colour after a short time.

I have also the honour to forward a piece of wood named "Ka Kende" styled here mahogany which I have had cut from a tree in the neighbourhood of Manoh Salijah
Height of Tree about 40 feet (Berlinia auriculata ?)
Girth about 2 feet from ground about 5' 4"
Specimen cut about 1' 6" from ground.

One of the peculiarities of this wood was a thick substance resembling white paint which ran through the heart of it." Sd. T. J. Alldridge

Four samples of Sandalwood from Mysore. Two of each var. known as "Navilu" and "Naga" the wood of which is filled with small knots caused by the decay of adventitious buds. "Two vars. of Sandalwood are much esteemed in India under the names of Navilu (peacock) and Naga (Cobra) and are distinguished by their respective markings on the polished surface of the heartwood. It is further said that specimens of such wood are held in great veneration by the Hindoos." Extract from Mysore Govt Catalogue World's Columbian Fair Chicago p 2.

April 26th Bent Expedition to Hadramaut, S. Arabia 50.

The following specimens collected by Mr W. Lunt

1. Portion of a branch of a bushy tree with indistinct whitish green flowers, growing to a height of 9 to 12 feet (Achyranthes aspera)
2. Roots from which a colouring matter is obtained used for painting the bodies of the natives, more especially women and children
3. Rope made of fibre obtained from the leaves of a palm, Native name "Saaf" - It is first soaked in water for two or three days, then beaten out with pieces of wood, and afterwards dyed with a brown dye probably the one called by the natives "Catad"
4. Tobacco cultivated at Ghail-babazir - it is sown about November and when large enough is transplanted about 9 inches apart each way, when about 4 or 5 inches high the growth is stopped, it the makes about three branches, when it is about 12 inches high it is again stopped - when the leaves are mature the plants are cut down, hung on poles to dry and is then ready for use
5. Specimens of rope and fibre obtained, from Sansevieria Ehrenberghii, from Mr C. McConkey Aden
6. Shrub ground into powder and used by the natives to mix with Indigo for dyeing purposes
7. Indigo as prepared by the natives
8. Specimen to show the juncture between Nos 95 and 99

April 26th 1894

Bent Expedition continued 50

9. Plants of Anastatica hirochuntica found in dry stony places said to be used to relieve pain during pregnancy, the plant is placed in water until it expands, when the water is drank (about ½ tumbler)

10. Stem of a procumbent palm - it grows to the height of about 2 feet.

11. Specimen of so-called soap obtained from a grass

12. "Carad" used for colouring skins a brownish colour, the leaves are placed in water until the colouring matter is extracted then the skins are placed in it for a few hours - Probably obtained from No. 186.

13. "Foowah" - the plant is put into water and crushed the solution being put upon wounds for healing purposes (Rubia tinctorum R. cordifolia)

14. "Usfar" (Carthamus tinctorius) soaked in water, dried, powdered and used for painting the face and body

15. Sample of "Neel" cultivated for the production of an Indigo dye.

16. "Luban Dhakar" obtained from a bushy shrub about 4 to 5 feet high, the thick stems are gashed with a small axe, the substance exudes in a watery state and when hardened is collected and used as incense in houses being placed on a small tray with a piece of charcoal and carried through the house

17. "Luban Dhakar" selected from the above

Takow, Formosa, China
1. Fruits of Diospyros utilis (815)
2. Plant of Balanophora Placed temporarily in case (525)
3. Fruits " Actinidia (1604)
4. " " Eugenia (501D)
5. Root " Morus alba the root-bark of which is used by the savages for making into one kind of "savage cloth" I have already sent in a letter a specimen of the fibre & of the cloth (Rec. 16 4 94) The dried specimens of 134 will be sufficient to determine the species. Note Another kind of savage cloth is made from the bark of Sterculia platanifolia but of this I have not yet obtained specimens (134)
6. Fruits of Arenga Engleri, Becc. This pretty palm occurs on Ape's Hill and has been introduced

1894

ug 16th Dr. Henry contd.
into the Hongkong Botanic Garden from Tamsui by Mr. Ford. (798 c.)

7. Fruit of Cucurbitaceæ (Trichosanthes japonica, Regel) (1653)
8. Bark of a tree [illegible] used by the savages for dyeing ropes (414) also piece of rope, so dyed
9 Fruit of Cucurbitaceæ (Citrullus vulgaris, Schrad.) (380)
10. Root used for making Opium pipe stems - I now doubt very much if this is the root of the dried plant numbered 464: but I will enquire. Plant identified at Herb. as Zanthoxylum nitidum (464) - root entirely different ([illegible])
11. Fruit of a tree (Echinocarpus dasycarpus, Benth.) (1654)
12. Leaf of Arenga Engleri, Becc. (798)
13. " " Livistona (Trachycarpus?) (821)
14. Seaweeds exported from Tamsui (1762) Suhria pristoides J.Ag. (& 1763 Gelidium amansii, Lamx.)
15. Tubers of Shu-lang (Dioscorea rhipogonoides, Oliv.
"Shu-lang was first discovered by Mr. Ford in Hongkong; and is described in Hook. Ic. Plant. tab. - No mention is made there of its economic importance, and I believe it was not until Mr. Ford made his excursion up the Canton river that he became aware of the use of the root as a dye. The Chinese hunt for it in Hongkong and little of the plant is left there on that account. In Formosa the plant occurs plentifully in the mountains; and the roots are brought to the coast where they are much used by the fishermen for dyeing and tanning their nets. I am not aware that any export occurs from Formosa. The root (& plant as well)

1894

May 16th. Dr. Henry contd. 59.

is known by the Chinese as Shu-lang, and occurs in commerce as "dye-root" or "dye-yam" while in Tonkin the French apply to it the name "faux gambier". The Customs Trade Report for Pakhoi 1882, says it is imported there from Annam, being a tuberous root called Shu-lang or faux gambier. It is extensively used at Pakhoi in dyeing coarse native cotton cloth and fishing nets a dark brown or tan colour.

The lately opened Customs Station on the Kwangsi-Annam frontier - Lungchow - is at present the seat of the trade, and the following quotations are from Customs Trade Reports on that port for the years 1889 + 1891. Lungchow.

"The principal article imported into Lungchow in 1889 was Shu-lang 3,700 piculs, value 4437 taels (over 200 tons, £1100). It is a tuberous root growing wild in the hilly districts of Tongkin. It is now to a certain extent cultivated, but cultivation, strange to say, deteriorates the quality. It is usually gathered in spring and early summer and is sent from here down the West River to Canton, where it is used to dye cloth that peculiar reddish black colour one so often sees in the South. The value locally ranges from $1½ to $3 a picul."

"In 1891 the import into Lungchow from Tonkin (districts of Thatke + Caobang)

1894

May 16th Dr. Henry contd.
of Shu-lang or faux gambier was 7000 piculs, valued at 16,762 taels (over 500 tons, value £4000)."

The 1889 and 1892 Reports give some further details as to the trade.

At Canton the root is chiefly used for dyeing grass-cloth (i.e. the light fabric made from Bœhmeria) and the kind of silk material known as Cantons both used much for summer clothing.

In the Chinese illustrated Botany (Chih-wu-ming IX.26) Shu-lang is figured and said to occur plentifully in the mountains of Fukien, Kwangtung and Kwangsi provinces. Its uses are described to be for dyeing fishing nets. The Chinese author says the stem has small thorns and that the root is hairy. He is perhaps speaking of another species.

The specimens now sent are Formosan roots and are, I think, unquestionably Dioscorea rhipogonoides. The leaf specimens V-105 were attached to the root, so that there is no doubt about these specimens. Mr. Ford is sure that the Canton root is from the same plant. I have no specimens at present of Annamese Shu-lang; these could be procured from Pakhoi or Canton."

Provincia de Sevilla (España)

Extract of letter from donor dated Palacio de Villamanrique 27.4.94. "It was picked up in a large Pinar or pine forest which I own in this neighborhood by one of my keepers a day I was out shooting. The young tree was then about six inches long; The woodmen of this country say they never saw anything like it. I took the cone home and left it alone on a table about the middle of February. It went on growing for a month - made a stem more than a foot long with three branches and even threw out new shoots - About the end of

June 1894

11th The Comte de Paris contd. 77.

March although it was watered, it ceased to grow and dried although the needles did not fall and preserve their colour. "The cone was found on the ground in the Pinar de los lobos on my estate of the Coto del Rey near Seville by one of my keepers a day I was out shooting in February 1891."

1894

ember 26th — Mr. J. M. Rose ✓ — 150

Assistant Botanist, U. S. Dept. of Agriculture
Washington

Portion of stem and fruit of Cereus pecten-aboriginum, Engel. Guaymas, Mexico Coll. Dr. Palmer. See Rose's Contrib. Nat. Herb. p. 189. The following information concerning this species was obtained from the Herb. Kew. Thirty feet high, 1 ft. or more in diam. with many branches, "Cordon" or "Hecho". Hacienda San Miguel Indians grind the seeds to mix with their meal. The bristles covering the fruit are used for hair brushes. Dr. Palmer obtained brushes in 1869 from the Papago Indians.

26th — H. N. Ridley Esqre. — 151.

Pine knot from Richmond River or Moreton

39/2

June 1895.

19th. J. H. Maiden Esqre contd. 80.

Bunya Pine (Araucaria Cunninghamii). These "knots" are highly esteemed for fuel in the districts in which the trees grow and also to some extent for turnery, flat-rulers and other small articles. They are found from 1ft. to more than 2 ft. long. They are the bases of the branches which penetrate a considerable distance into the trunk. The best "knots" are said to be obtained from half decayed trees, but this is open to question. The Araucaria timber readily decays on exposure and these "knots" are found scattered on the ground in the pine forests, doubtless owing their preservation to the abundant resin they contain. (Not kept) (The letter from Mr Maiden accompanying this specimen has been placed with arranged notes on Economics in Museum Library under instructions from Director 29.7.95 (M.H.)
